

Food Delivery Dashboard

Demand, member behavior, and delivery performance across four months of order data.

Subrata Sarkar

Project Blueprint

The Platform

A Power BI dashboard built on a food delivery dataset modeled after major platforms like Zomato.

The Timeline

Covers customer, restaurant, and food data alongside complete order transactions from January to April.

The Goal

Understand what is being ordered, by whom, and exactly how reliably it is getting delivered.

Connecting the Data Architecture

Starting point: 7 disconnected Excel files

Required: Relationship mapping

Final state: Integrated relational model

Defining the Analytical Scope

What We Have	What We Don't Have
Volume metrics and order quantities	Sales revenue or gross merchandise value
Behavioral shifts and loyalty tier tracking	Individual sale amount fields
Operational fulfillment performance	Production-scale massive data volume
A compact, constrained dataset (30 customers)	

Constraint as a feature: Removing revenue forces a sharper focus on true human behavior and mechanical reliability.

The Baseline Engine: Four-Month Totals

15.10K

Total Units Sold

2.75K

Total Orders

6

Average Units
per Order

94.25%

Delivery Rate

5.75%

Cancellation Rate

30

Total Customers

A Shift in Demand, Not Fulfillment

Behavior Driven by Loyalty Tiers

1

Main Course & Snacks account for nearly 75% of total platform volume.

2

Appetizers barely register, driving less than 1% of total units.

3

Gold members significantly out-order Regular members across every single menu category, proving the universal uplift of the loyalty tier.

	Gold	Regular
Main Course	4270.00	2629.00
Snack	2807.00	1672.00
Breakfast	1055.00	510.00
Dessert	1034.00	535.00
Beverage	323.00	172.00
Appetizer	68.00	28.00
	9557.00	5546.00

High Concentration in Menu and Payments

The Pareto

Top Items (Total Quantity)

The Transaction

India's digital payment ecosystem dominates; cash on delivery is a distant second.

A Tool Built for Exploration

Month

Member_Type

Payment_method

Food Type

Restaurant Type

Dynamic Filtering: Slice data instantly by time, user, payment, and product category.

Isolated Segments: Every metric automatically recalculates to isolate specific operational variables.

Beyond Headlines: The aggregate numbers are designed to be the starting point of an investigation, not the end.

Project Synthesis

Data Engineering

Successfully mapped and modeled a cohesive relational schema from seven entirely disconnected source files.

Technical Execution

Engineered complex DAX measures to accurately calculate fluctuating operational rates and proportional shares.

Analytical Approach

Demonstrated the ability to extract deep behavioral insights within strict data constraints (absence of sales figures).
